

BEFORE YOU PRESENT: Slide 1 still reads “ADD TEAM ID FROM SIH PORTAL” in red. Fill it in, and open the deck once in PowerPoint to check the fonts hold.

If you remember one thing, say this: **Coal India already knows what the law requires and already runs the sensors. Nothing connects the two — so compliance is proved on paper, months late, by the people being assessed.**

1 Title Page

20 sec

ON SCREEN PS ID, title, theme, category, team. Product name ANUPALAN.

- “We’re NeuraForge. Problem statement SIH26024, from Coal India under the Ministry of Coal.”
- “Our solution is ANUPALAN — the Hindi word for compliance.”
- **Do not linger here.** Move straight on.

2 Proposed Solution — your main slide

90 sec

ON SCREEN Left: what it is, how it fixes the problem. Right: 5-step loop diagram, then the three innovations.

- **Open on the gap, not the tech.** “The CAG found sixteen CIL units operating without valid statutory clearance. The national safety committee’s own February 2025 minutes record dust-suppression figures that don’t match field conditions.”
- “Nobody is lying. Compliance is just proved on paper, months later, by the party being assessed.”
- **Then walk the diagram, left to right.** Ingest the law → every clause becomes a tracked duty with an owner and a deadline → field officers capture evidence offline → we score risk **before** the breach → an officer signs the return.
- **Land the three differentiators:** the rulebook updates itself; we predict instead of record; evidence cannot be back-dated.

3 Technical Approach

60 sec

ON SCREEN Six stack cards on top. Below, the five-layer architecture — two blocks tagged NEW.

- **Do not read the boxes aloud.** Trace the flow with your hand, top to bottom.
- “Five engines in the AI core: Regulation-as-Code, the risk engine, hazard early-warning, geo-compliance, vision triage.”
- **Your strongest thirty seconds:** “We are not asking Coal India to buy a single sensor. ETMS, methane detectors, strata monitors, geo-fenced vehicle tracking — the Ministry’s own annual report lists them as already deployed. That data exists. It sits in silos. We read it.”

4 Feasibility and Viability

45 sec

ON SCREEN Three columns: feasibility, risks, mitigations. Below, the 36-hour build plan.

- “Entirely open source. Zero licence cost. Runs on NIC MeghRaj or Coal India’s own data centre.”
- **Name the risk before they do:** “An AI misreading the law is a serious liability. So it drafts and cites the clause, and a certificated officer signs. It never auto-files a statutory return.”
- “Rules first, model later — deterministic checks ship on day one.”

5 Impact and Benefits

45 sec

ON SCREEN Five stat tiles, two benefit columns, measurable pilot targets along the bottom.

- “313 working mines. A workforce of 3.3 lakh, of which 1.15 lakh are contract workers — the same people the safety committee noted are left out of safety committees.”
- “For DGMS: verified, clause-linked evidence instead of self-declared PDFs, so scarce inspector time goes to the highest-risk mines first.”
- **Finish on the targets row.** “Inspection to filed report, weeks down to under twenty-four hours. Statutory returns auto-drafted, zero to eighty per cent.”

ON SCREEN Eight sources: CAG, Standing Committee minutes, DGMS, the statutes, CIL, PIB, PARIVESH, CPCB.

- “Every number in this deck is government-sourced — the CAG, the Standing Committee's own minutes, DGMS, PIB.”
- **Close on this:** “The Mines Act of 1952 is repealed the day the OSH Code is notified. Every compliance system with rules hard-coded into it breaks that morning. Ours parses the corpus and re-derives every duty overnight. That is why we built a rulebook that reads the law.”

The four questions you will actually get

“Coal India already has CSIS and the Safety Report Portal. Why another system?”

Those record what already happened. Both are inputs to us, not competitors — the architecture reads from them. What doesn't exist anywhere is a forward-looking obligation ledger derived from the statute itself.

“What if your AI misreads a provision? Who is liable?”

The AI never files, so it never carries liability. It drafts and must cite the clause it relied on; an answer with no citation is rejected by the system. A certificated officer signs. That's the same accountability chain the Mines Act already sets out.

“There is no network underground. How does the app work?”

Offline-first by design, not offline-tolerant. Capture writes to a local store, the queue holds it, and it uploads with conflict resolution when the phone reaches the surface.

“Where does the training data come from?”

Historic inspection findings, violation records and accident data held by CIL and DGMS, plus each mine's own sensor history. Early scores will be thin, which is why deterministic rule checks ship first — “this return is nine days overdue” needs no training at all.

Walking in

- **One person presents.** Others answer only in their own area when asked directly. A chorus reads as unprepared.
- **Decide now** who takes AI questions, who takes architecture, who takes regulation and domain.
- **If you don't know something, say so** and say how you'd find out. One honest “we haven't validated that yet” buys you credibility on everything else.
- **Total runtime is about four and a half minutes.** Leave room to be interrupted — reviewers usually do.
